Perfect—since your deck has **proposed methodology + literature review**, the cleanest way to divide work is by *logical sections*, not by slide count. That keeps the workload even and avoids overlap.

Here's a **balanced 3-person division** you can use in Canva 👇

👤 Person 1 — *Introduction + Literature Review*

Goal: Set the context and show what's missing in prior work.

Slides they make:

1. **Title Slide**
    - Project title
    - Authors
    - Institution / course
2. **Motivation & Problem Statement**
    - What is chart reasoning?
    - Why OOD generalization matters
    - "Reasoning collapse" issue
3. **Background: Chart-RVR & RLVR**
    - What is RL from Verifiable Rewards?
    - How GRPO is used in Chart-RVR
4. **Literature Review – Key Papers**
    - Wang et al. (2022) – Self-Consistency (inference-time)
    - Sinha et al. (2025) – Chart-RVR
    - Zhu et al. (2025) – NSR
    - Shao et al. (2024) – GRPO
5. **Limitations of Existing Methods**
    - Collapse to single strategy
    - No active diversity signal
    - Poor OOD performance

📦 **Deliverable:** Slides that clearly answer
👉 *"What has been done, and what's still broken?"*

👤 Person 2 — *Proposed Method: SCR-RLVR Core Idea*

Goal: Explain your **main contribution** clearly.

Slides they make:

6. **Our Contribution Overview**

- SCR-RLVR = NSR/W-REINFORCE + Self-Consistency Reward

7. **Policy Update Methods**
    - GRPO vs NSR vs W-REINFORCE
    - Table: Diversity vs Accuracy tradeoff
8. **Self-Consistency Reward (R_sc)**
    - Intuition: “Different paths → same answer = robust”
    - Define:
        - C_ans (Answer Consensus)
        - D_reason (Reasoning Diversity)
9. **R_sc Formula Slide**
    - $R_{sc} = w \cdot C_{ans} \cdot D_{reason}$
    - 4-case interpretation grid:
        - High C + High D → Best
        - High C + Low D → Fragile
        - Low C + High D → Unreliable
        - Low C + Low D → Confused
10. **Why This Is Novel**

- Self-consistency at *training time*
- Not just inference-time voting

📦 **Deliverable:** Slides that answer

👉 *“What is new, and why it’s smart?”*

👤 Person 3 — *Pipeline, Experiments & Results*

Goal: Show how it works + how you evaluate it.

Slides they make:

11. **SCR-RLVR Pipeline Diagram**

- Input → Rollouts → Parsing → Rewards → Policy Update

12. **Step-by-Step Training Flow**

- K rollouts
- Reward computation
- Self-consistency batch reward
- Advantage + gradient update

13. **Experimental Setup**

- Model, datasets, K=8, temperature, LR, epochs

14. **Experiment Matrix**
    - 6 experiments (GRPO/NSR/W-REINFORCE ± R_sc)
15. **Expected Results Table**
    - ChartQA vs EvoChart
    - Entropy
    - OOD gap
16. **Key Findings / Hypotheses**
    - R_sc improves OOD
    - NSR/W-REINFORCE preserve diversity
17. **Conclusion & Future Work**
    - Summary of contributions
    - Future: extend to other VLM reasoning tasks

📦 **Deliverable:** Slides that answer

👉 *"Does it work, and how do we know?"*

📐 Final Slide Count (Even Load)

Person	Slides	Focus
Person 1	~5 slides	Intro + Literature
Person 2	~5 slides	Core Method
Person 3	~7 slides	Pipeline + Experiments

If you want, I can next:

✔️ Turn this into a **Canva outline template**

✔️ Or write **exact slide text bullets** for each person

✔️ Or create a **presentation script** for speaking roles
